BAKER'S PRICE LIST
of
NURSERY STOCK
For Spring of 1941

Berry Plants
Fruit Trees
Ornamental Shrubs
Evergreens, Etc.

BERT BAKER
Hoosick Falls, N. Y.
Telephone 917-F3

A Message to Our Friends and Customers

In presenting to you, our friends and customers, this small catalog for 1941, we wish to express our thanks and appreciation for the excellent business you have given us this past year, and we want at this time to especially thank those who have been so kind as to recommend us to their friends and neighbors.

With the large and splendid stock we now have to offer, we look forward to the year 1941 to be our banner year.

We have many acres of Evergreens, Deciduous Trees, Shrubs, Berry Plants, etc., and their being grown in our cold climate makes our stock extremely hardy. By not printing an expensive colored catalog and not giving long and many times greatly exaggerated descriptions of the various items, we have been able to make our prices much less for the same quality of stock than most nurserymen are charging.

We are growing many items not listed and should there be something in which you are interested and it is not mentioned in this catalog, we will be glad to quote you a very attractive price on same, or should you be interested in a large number of anything that is listed, write us, for on some stock we might be able to quote a lower price.

VISITORS ALWAYS WELCOME.

LOCATION—We are located in the foothills of the Adirondack Mountains where the winter climate is very severe, making our stock much more hardy than that grown farther South. We are on the main line of the Boston and Maine Railroad and only a few miles from Vermont and Massachusetts.

CONDITIONS OF SALE—Five will be given at ten, fifty at one hundred and five hundred at one thousand rates.

Special plants selected by the customer will be charged according to their individual values.

We make no charge for boxing, excepting large Evergreens and large Shade Trees.

TERMS—Cash should accompany the order, or one-fourth when the order is sent and the balance before the shipment is made. Money may be sent any way that is most convenient to the sender.

GUARANTEE—We use every precaution to have our stock true to name, and if through mistake should any be sent that proved to be otherwise, we will gladly refill the order or return the money sent for same.

FREE FROM DISEASE—We send a State Certificate of Nursery Inspection with each order.

REFERENCES—Any Bank or Business House in Hoosick Falls, Dun & Bradstreet, Inc., and the leading nurserymen anywhere in the United States.

No Business Done on Sunday

RASPBERRIES

For over thirty years we have specialized in the growing of Raspberries and Raspberry Plants. During this time we have had a great deal of experience in all phases of the work, and have tested all the worthwhile varieties and many that proved inferior and have learned which are the most profitable to grow for market and those most desirable for home use. Should you want only a few plants for your garden or several thousand for a large commercial planting, we believe we can give you the best of satisfaction.

All our Raspberry plants have had at least two official inspections and are certified as apparently free from Mosaic and other diseases.

TRANSPLANTS—We have several thousand heavy fruiting size transplants. These are recommended when fruit is wanted the same year in which the plants are set.

HOW TO GROW RASPBERRIES

We receive each year so many inquiries as to the care and culture of Raspberries that we deem it advisable to give a brief description of what we believe to be the best methods to follow.

As a well taken care of block of Raspberries is productive for several years, a considerable amount of attention should be given in choosing a proper site. It is generally considered that any soil that will produce a good crop of corn or potatoes is suitable for growing Raspberries. However, they will not thrive on soil that is soggy or where the water level is too near the top of the ground at any time of the year, and as the growth of the canes and the ripening of the berries takes place at a time when the supply of moisture is often deficient, they should, if possible, be set on ground that is fairly retentive of moisture. While not necessary, it is advisable that the place chosen be one upon which was grown the previous year some well cultivated crop like corn or potatoes.

A thorough preparation of the soil, same as for any garden crop, is of prime importance, and the best time for transplanting is as early in the spring as the ground is in good condition to work. On ground that does not heave badly during the winter, fall transplanting has some advantages.

It is very important that the plants be purchased from sources where the plants have been properly inspected by the State Inspectors and found to be apparently free from diseases.

As for setting, we do ours with a tractor drawn transplanting machine. For smaller plantings it is usually done by making a shallow furrow with a plow and setting the plants in the furrow. On light soil it is well to set the plants two or three inches deeper, and on heavy soil not over an inch deeper than they grew in the nursery. Care should be taken that whatever method is used in transplanting, the soil be pressed very firmly around the roots of the plants.

The narrow hedge row system is generally the most profitable to

follow and we recommend that the plants be set in rows six feet apart and the plants from two to three feet apart in the rows. The closer they are set in the row the more fruit you will get the year following the one in which the plants are set. If the hill system is to be used, they should be set in rows about five feet each way. Black Caps and Purples should be set in rows seven feet apart and the plants about three feet apart in the rows. To determine the number of plants to be set to an acre, multiply the distance the plants are to be set in the row by the distance between the rows. Then divide 43,560 (the number of square feet in an acre) by that product. The result will be the number of plants required. Great care should be taken that the roots of the plants do not get dry before they are put in the ground.

After the plants are set, the ground should be kept thoroughly cultivated and hoed. After the plants have made a good start, shallow cultivation is important as many of the feeder roots are near the surface of the ground. In a climate where the plants are apt to winterkill, but very little cultivation should be done after they are through fruiting as too much cultivation at this time stimulates a late growth of cane which will not be sufficiently hardened before freezing comes to withstand the cold winter.

If the ground is in a good state of fertility before the plants are set but little fertilizer will be needed. If 200 to 300 pounds of nitrate of soda or sulfate of ammonia is applied per acre early each spring before growth of the plants starts, it will greatly stimulate their growth.

The care of Blackberries is very similar to Raspberries. It is better that they be set in rows eight feet apart.

As many State Experimental Stations publish excellent Bulletins on Raspberry growing, we suggest that everyone interested write to their Station for a copy. These Bulletins also name the best varieties for their particular state.

NEW VARIETIES

For several years at the New York State Experimental Station, Geneva, N. Y., a great deal of time has been spent in developing new and better varieties of Raspberries. They have tested thousands of seedlings produced by cross pollination from known parentage and after eliminating all but a few which showed improved qualities over the varieties that were on the market and after testing these for several years and becoming convinced that they possessed superior qualities to the older varieties, they introduced the Taylor, Marcy and Indian Summer reds and the Sodus purple. We have a nice stock of genuine true to name plants of these varieties and are offering them at very reasonable prices. We recommend that every grower try all these newer kinds.

TAYLOR—At the State Experimental Station, Geneva, N. Y., are being grown not only the older varieties of reds but also a large number of new ones and after fruiting it for several years they describe the Taylor as follows: "Taylor is the most promising red raspberry on the Sta-

tion grounds at the present time, and is offered for trial for both market and home garden. The plants are usually vigorous, hardy, productive, tall-growing and increase rapidly. The sturdy canes hold the berries well off the ground. The berries ripen shortly before Latham, are large, long-conic, bright attractive red, thick-fleshed, firm, subacid and of excellent quality. They do not cling to the bush as tightly as Newburgh."

MARCY—Description by the Experimental Station: "This red raspberry was offered for the first time in 1936. The berries, the largest of any variety in the Station collection, are long-conic, firm, thick-fleshed, medium red, mild in flavor and of good quality. The plants are tall, vigorous, healthy and hardy at Geneva. The sturdy canes, which should not need support, bear the fruit out in the open, thus facilitating picking. Marcy is worth trying for market and for home use, being especially noteworthy for the very large berries, vigor and productiveness of the plants". On our grounds the Marcy equals the description as to size of the fruit, yet in our climate, which is much colder than at Geneva, it is subject to quite severe winter-killing during a severe winter.

INDIAN SUMMER—A great new everbearing red, proving more satisfactory each year as it is fruited over wider areas, most decidedly superior to any of the other so-called everbearing red Raspberries. Ripens its first crop very early, a little ahead of Chief, and another crop beginning in September and continuing until a heavy freeze in late Fall. Berries are large, medium red in color and of excellent flavor. Plants are tall, thrifty growers, hardy, disease resistant and are of unusual beauty and attractiveness. It should be in every home garden and has great possibilities as a profitable variety to grow for a nearby market.

SODUS (Purple)—A cross between Newburgh red and Dundee black raspberry. The berries are enormous in size, attractive in appearance, delicious in flavor, firm in texture and do not crumble like Columbian. Bush is a strong rank grower, very hardy, tremendously productive and not so subject to disease as Columbian.

NEWBURGH—Originated a few years ago on the grounds of the New York State Agricultural Experimental Station, Geneva, N. Y. After fruiting it for several years, they describe it in their 1940-41 Catalog of New Fruits as follows: "Is proving to be a very satisfactory berry for market purposes. The fruit is very large, very firm, and does not crumble. The color is bright, attractive red; in keeping and shipping quantity it has no superior. The plants are vigorous, hardy and very productive; the weight of the fruit is so great that the canes are often bent to the ground. The fruit is borne out in the open where it may be readily picked. Under average conditions such as prevail in central and western New York, mosaic is rarely serious in Newburgh. In season it is three or four days earlier than Cuthbert. The canes should be cut back one-fourth to one-third at the regular dormant pruning in early spring, since this variety tends to overbear if not cut back. This should improve the picking quality somewhat".

LATHAM—Originated in Minnesota where the winters are very cold.

A great money maker. Bush is hardy and yields immense crops of large berries that bring the highest price in the markets. Fruit ripens over a long period and the last berries are as large as the first. Has been the most famous and widely planted red raspberry in the country, is now being replaced in many places by the better quality varieties that have been developed at our own State Experimental Station.

CHIEF—A seedling of Latham, originating in Minnesota, and fruit ripens about a week earlier than Latham. Produces a large crop at the season when berries are high. Plants are hardy, very resistant to disease and good money makers.

JUNE—The earliest red—Originated at the N. Y. State Experimental Station, Geneva, N. Y., over 25 years ago. Ripens its fruit a little earlier than Chief and is very productive of large berries and of good quality.

CUTHBERT—The Standard of quality by which all other reds are judged.

ST. REGIS (Everbearing)—Until the introduction of the Indian Summer, St. Regis was by far the best of the everbearing reds. Still extensively grown in some localities.

GOLDEN QUEEN—The best yellow raspberry, almost identical with Cuthbert, excepting color.

COLUMBIAN—Until the introduction of the Sodus, the Columbian was not only the leading purple but the most productive of all raspberries.

CUMBERLAND—Generally considered the most satisfactory black raspberry.

MARION (Purple)—A new Station variety highly recommended and ripens its fruit about a week later than Sodus. In size of fruit the largest of the purple.

BLACKBERRIES

SNYDER—The hardest and most reliable blackberry for the North.

ELDORADO—Large, long berries, sweet luscious flavor, jet black in color and has no hard core.

BOYSENBERRY

Perhaps in a climate where the winters are less severe than ours, this highly advertised berry will prove to be somewhat worthy of the marvelous qualities it is claimed to possess. We have fruited the Boysenberry for three years and would describe the fruit as very large in size, unattractive in appearance, of poor quality and the plants unproductive.

We have some nice plants to offer at 15c each; \$1.75 per 25; \$5.00 per 100; \$37.50 per 1000.

BLUEBERRIES

Blueberries are becoming more popular each year and are very suitable for our cold northern climate.

We have to offer 2-yr. 12-18 in. size of Cabot, Pioneer and Rubel at 75c each; 10 or more at 55c each, and 2- and 3-year 18-24 in. size at 90c each; 10 or more at 75c each.

PRICES OF BERRY PLANTS

Special Trial Offer

To those who wish to try all four new varieties introduced by the New York Experimental Station—Taylor, Marcy, Indian Summer and Sodus—we are pleased to quote No. 1 and Heavy Fruiting Size Transplants as follows:

	No. 1	Trans.
12 each by prepaid Parcel Post.....	\$ 2.50	\$ 3.50
25 each by prepaid Parcel Post.....	4.25	6.25
100 each, purchaser to pay transportation charges.....	10.50	15.00
1000 each, purchaser to pay transportation charges.....	75.00	115.00

RED, PURPLE AND BLACK RASPBERRIES

On orders calling for 25 or less of a variety, we pay the postage; on orders at the 100 or 1000 rates, we will ship by Parcel Post or express, charges to be paid when you receive the plants, or if a sufficient sum is sent with the order to cover the postage, we will send by prepaid Parcel Post.

50 at 100 and 500 at 1000 rates.

FRUIT TREES

We have to offer this year for the first time some quintuplet trees in Apple, Pear and Plum. These trees have five varieties of fruit on each

tree, ripening from early to late, and are not only just the thing for the small city lot, where space is limited, but a few trees should be in every back yard. The Apple Trees are large 5-6 feet in height, the Pear and Plum are a little smaller and the price is \$1.25 per tree, regardless of the number taken.

REGULAR FRUIT TREES

2 and 3 yr. No. 1 5-6 ft. in height 11/16 in. and up in diameter. 75c each; \$6.50 per 10; \$45.00 per 100.

APPLES—Baldwin, Cortland, Delicious, McIntosh, Northern Spy, Red Astrachan, R. I. Greening and Yellow Transparent.

PEARS—Bartlett, Clapp's Favorite and Seckel.

PLUMS—Burbank, Lombard and German Prune.

CHERRIES—Early Richmond, English Morello and Montmorency.

SWEET CHERRIES—Black Tartarian, Governor Wood and Windsor.

PEACHES—Elberta, J. H. Hale and Rochester 4-5 ft. in height, 50c each; \$4.00 per 10; \$30.00 per 100.

BLEEDING HEART (Large field grown)

40c each; \$1.00 for 3; \$2.75 per 10.

SHRUBS
